

The background of the slide is a composite image. On the left, there's a blue diagonal band. The main background shows a city skyline with various skyscrapers under a cloudy sky. Overlaid on the right side of the skyline is a large, semi-transparent orange shape that contains a close-up image of two hands shaking, symbolizing a deal or agreement.

Turn the Domain into Use **with Domain Connect**

What turns domain into use

- Idea and use-case
- Domain registration
- Service
- Content
- DNS Configuration

What turns domain into use

- Idea and use-case
- Domain registration
- Service
- Content
- **DNS Configuration**

DNS configuration “challenge”

- Example MS O365 configuration:
 - 6 Step process
 - 7-15 DNS entries
 - 16 help sites (10 registrar-specific)
 - ... or 40 minutes training
- Result? 50% would fail and abandon the process

Add or edit an SPF TXT record to help prevent email spam (Outlook, Exchange Online)

Before you begin: If you already have an SPF record for your domain, don't create a new one for Microsoft 365. Instead, add the required Microsoft 365 values to the current record on your hosting providers website so that you have a *single* SPF record that includes both sets of values.

On your hosting provider's website, edit the existing SPF record or create an SPF record. Make sure that the fields are set to the following values:

- Record Type: `TXT (Text)`
- Host: `@`
- TXT Value: `v=spf1 include:spf.protection.outlook.com -all`
- TTL: `3600`

Save the record.

Validate your SPF record by using one of these [SPF validation tools](#)

What is Domain Connect

What is Domain Connect

- Open Standard protocol first proposed by GoDaddy in 2016
- Makes DNS setup to integrate 3rd party products and DNS setup less complicated and error prone
- Minimum authorization scope based on templates
- Customer experience that is simple, integrated and seamless
- Operational gains for both service and DNS providers

How it works?

Features

- Templates that define the API contract between the providers
- 2 flows:
 - One-off synchronous flow
 - Recurrent asynchronous flow using OAuth
- Conflict resolution on RR level
- Merging of SPF TXT records from different services
- Support for ephemeral records (like ownership verification)
- URL protected with signature

Implementation status

- DNS Providers
 - ~20 providers, incl. GoDaddy, IONOS, Cloudflare, Squarespace Domains (former Google), Wordpress.com or Plesk
 - Upcoming name.com + some other undisclosed
 - 35% of the .com zone (May'24)
- Service Providers
 - 300 templates from over 120 providers, incl. O365, Google Workspace, Apple Cloud+, Weebly, Squarespace...
- The specification is quite stable now, but still some providers reluctant to adopt a non-standard.
 - ➡ this is now being addressed through IETF process

Possible other use cases

- More registrar/registry related use-cases:
 - DNSSEC bootstrapping (alternative to CDS/CDNSKEY)
 - Nameserver change
 - Registrar discovery would have to be solved:
 - RDAP
 - or DNS
- Sell + configure flow:
 - Instead of configuring an existing domain registrar would directly register a new one and configure DNS

How can I help?

- Follow and contribute to the mailing list and standard development: <https://mailman3.ietf.org/mailman3/lists/dconn.ietf.org/>
- Watch out your zone for _domainconnect records
- Spread the word, make your registrars aware
- Website: <https://www.domainconnect.org/>
- LinkedIn: <https://www.linkedin.com/company/domain-connect/>

THANK YOU!
