

The background of the slide is a composite image. On the left, there is a dark blue diagonal band. The central part shows a city skyline with a prominent skyscraper under a cloudy sky. On the right, there is an orange diagonal band featuring a close-up of hands shaking in a firm grip.

Domain Connect

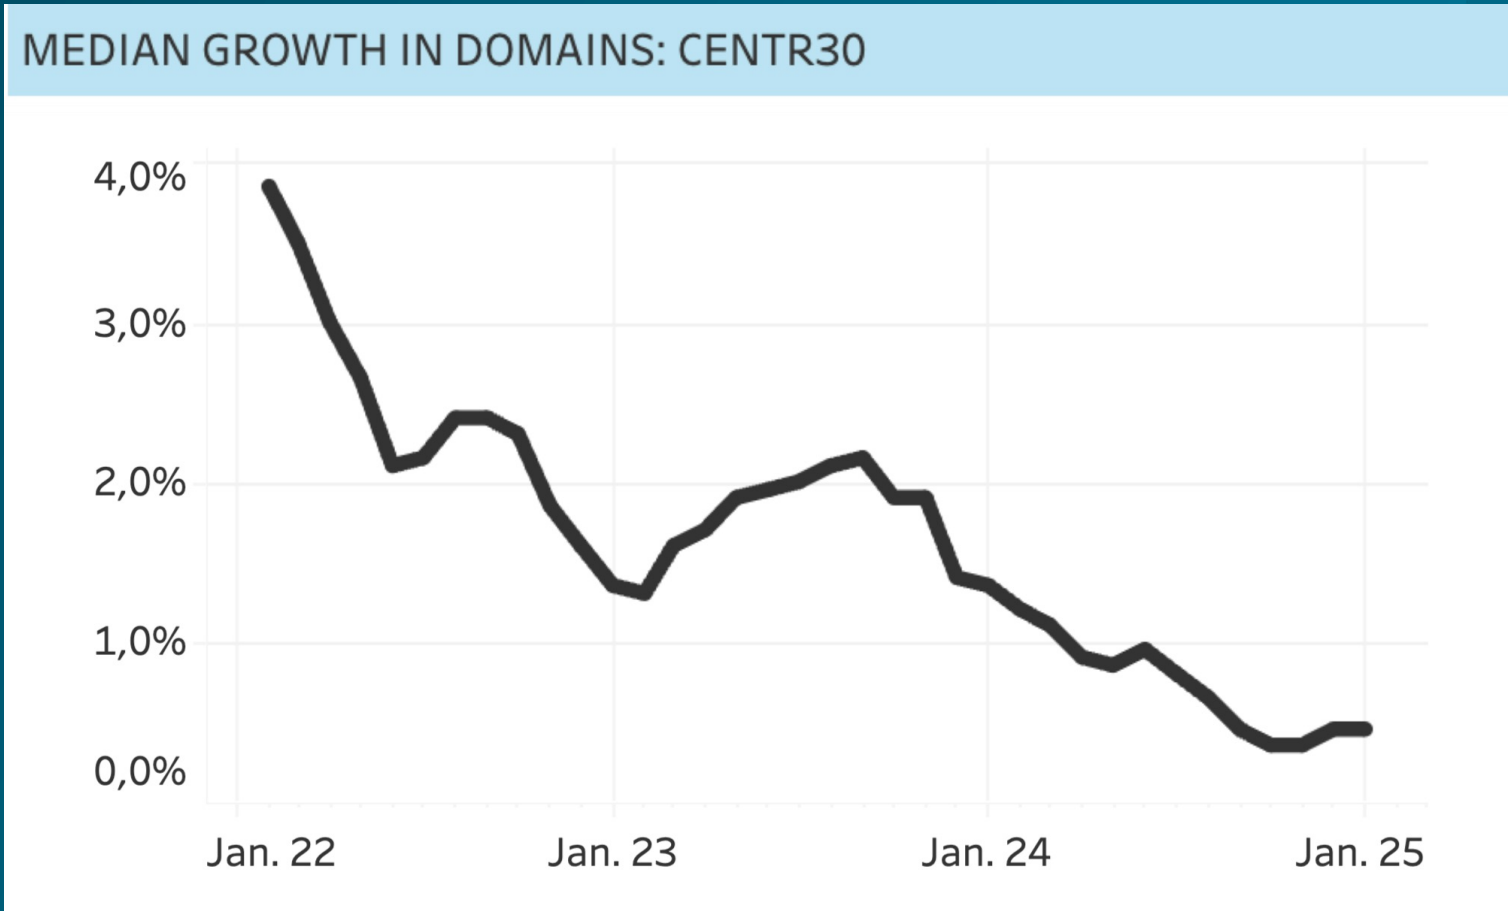

a missing piece in DNS toolbox

Pawel Kowalik - Head of Product Management – DENIC

Registration Operations Workshop – Oct 2025

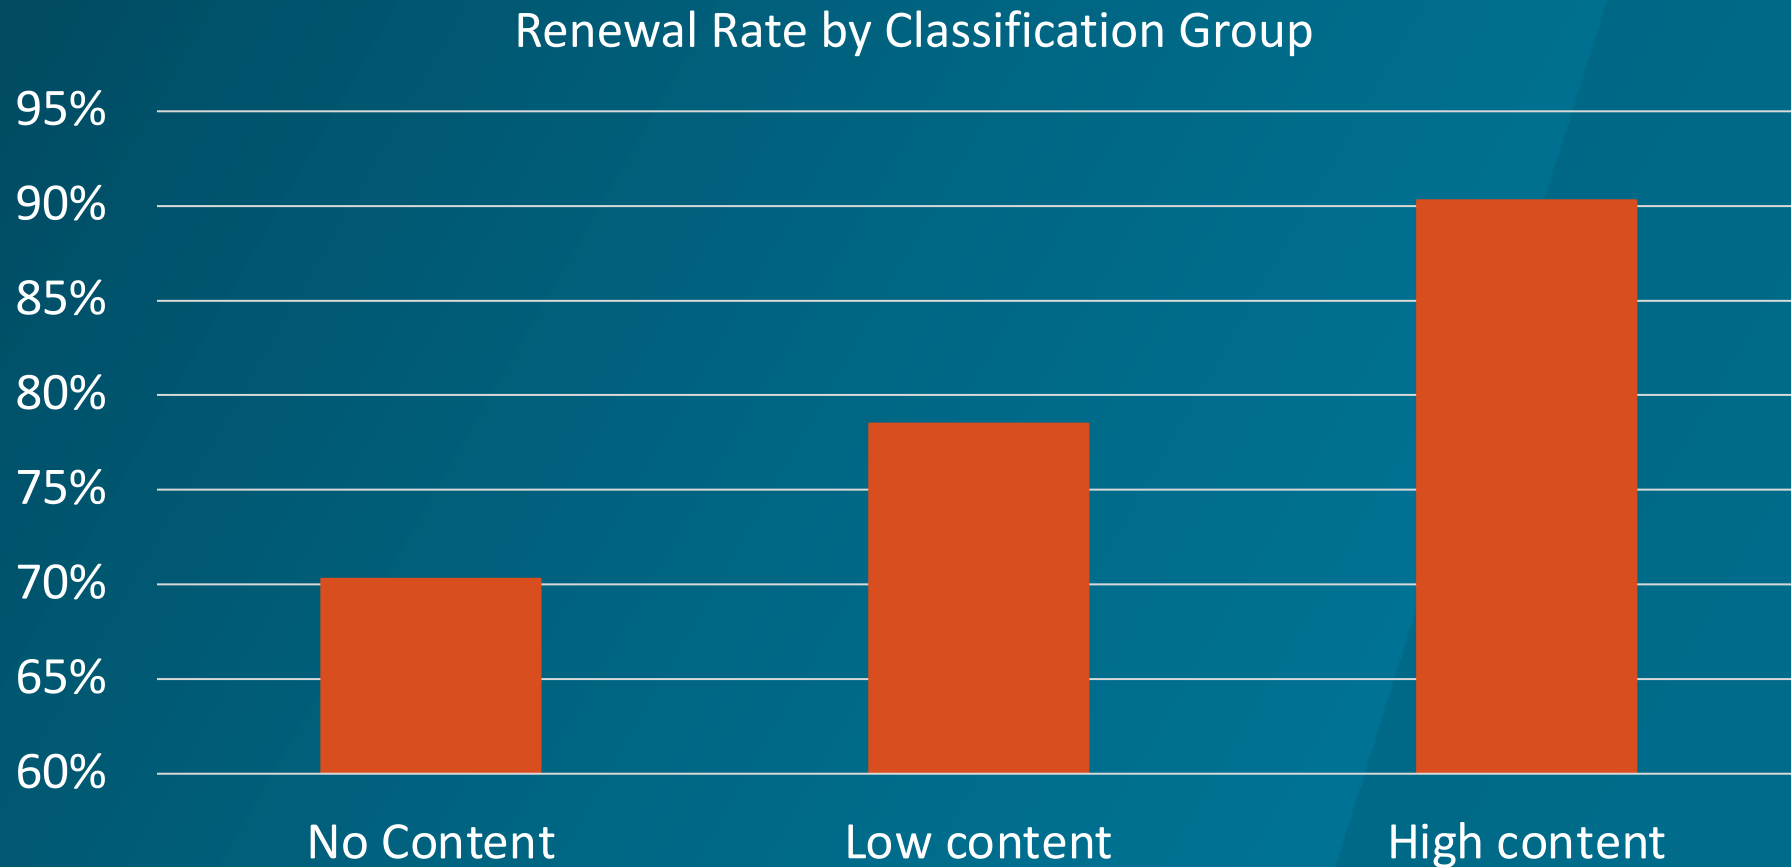

Current challenge: domain growth

What turns domain into use

- Idea and use-case
- Domain registration
- Service
- Content
- DNS Configuration

What turns domain into use

- Idea and use-case
- Domain registration
- Service
- Content
- **DNS Configuration**

DNS configuration “challenge”

- Example MS O365 configuration:
 - 6 Step process
 - 7-15 DNS entries
 - 16 help sites (10 registrar-specific)
 - ... or 40 minutes training
- Result? 50% would fail and abandon the process

Add or edit an SPF TXT record to help prevent email spam (Outlook, Exchange Online)

Before you begin: If you already have an SPF record for your domain, don't create a new one for Microsoft 365. Instead, add the required Microsoft 365 values to the current record on your hosting providers website so that you have a *single* SPF record that includes both sets of values.

On your hosting provider's website, edit the existing SPF record or create an SPF record. Make sure that the fields are set to the following values:

- Record Type: `TXT (Text)`
- Host: `@`
- TXT Value: `v=spf1 include:spf.protection.outlook.com -all`
- TTL: `3600`

Save the record.

Validate your SPF record by using one of these [SPF validation tools](#)

What is Domain Connect

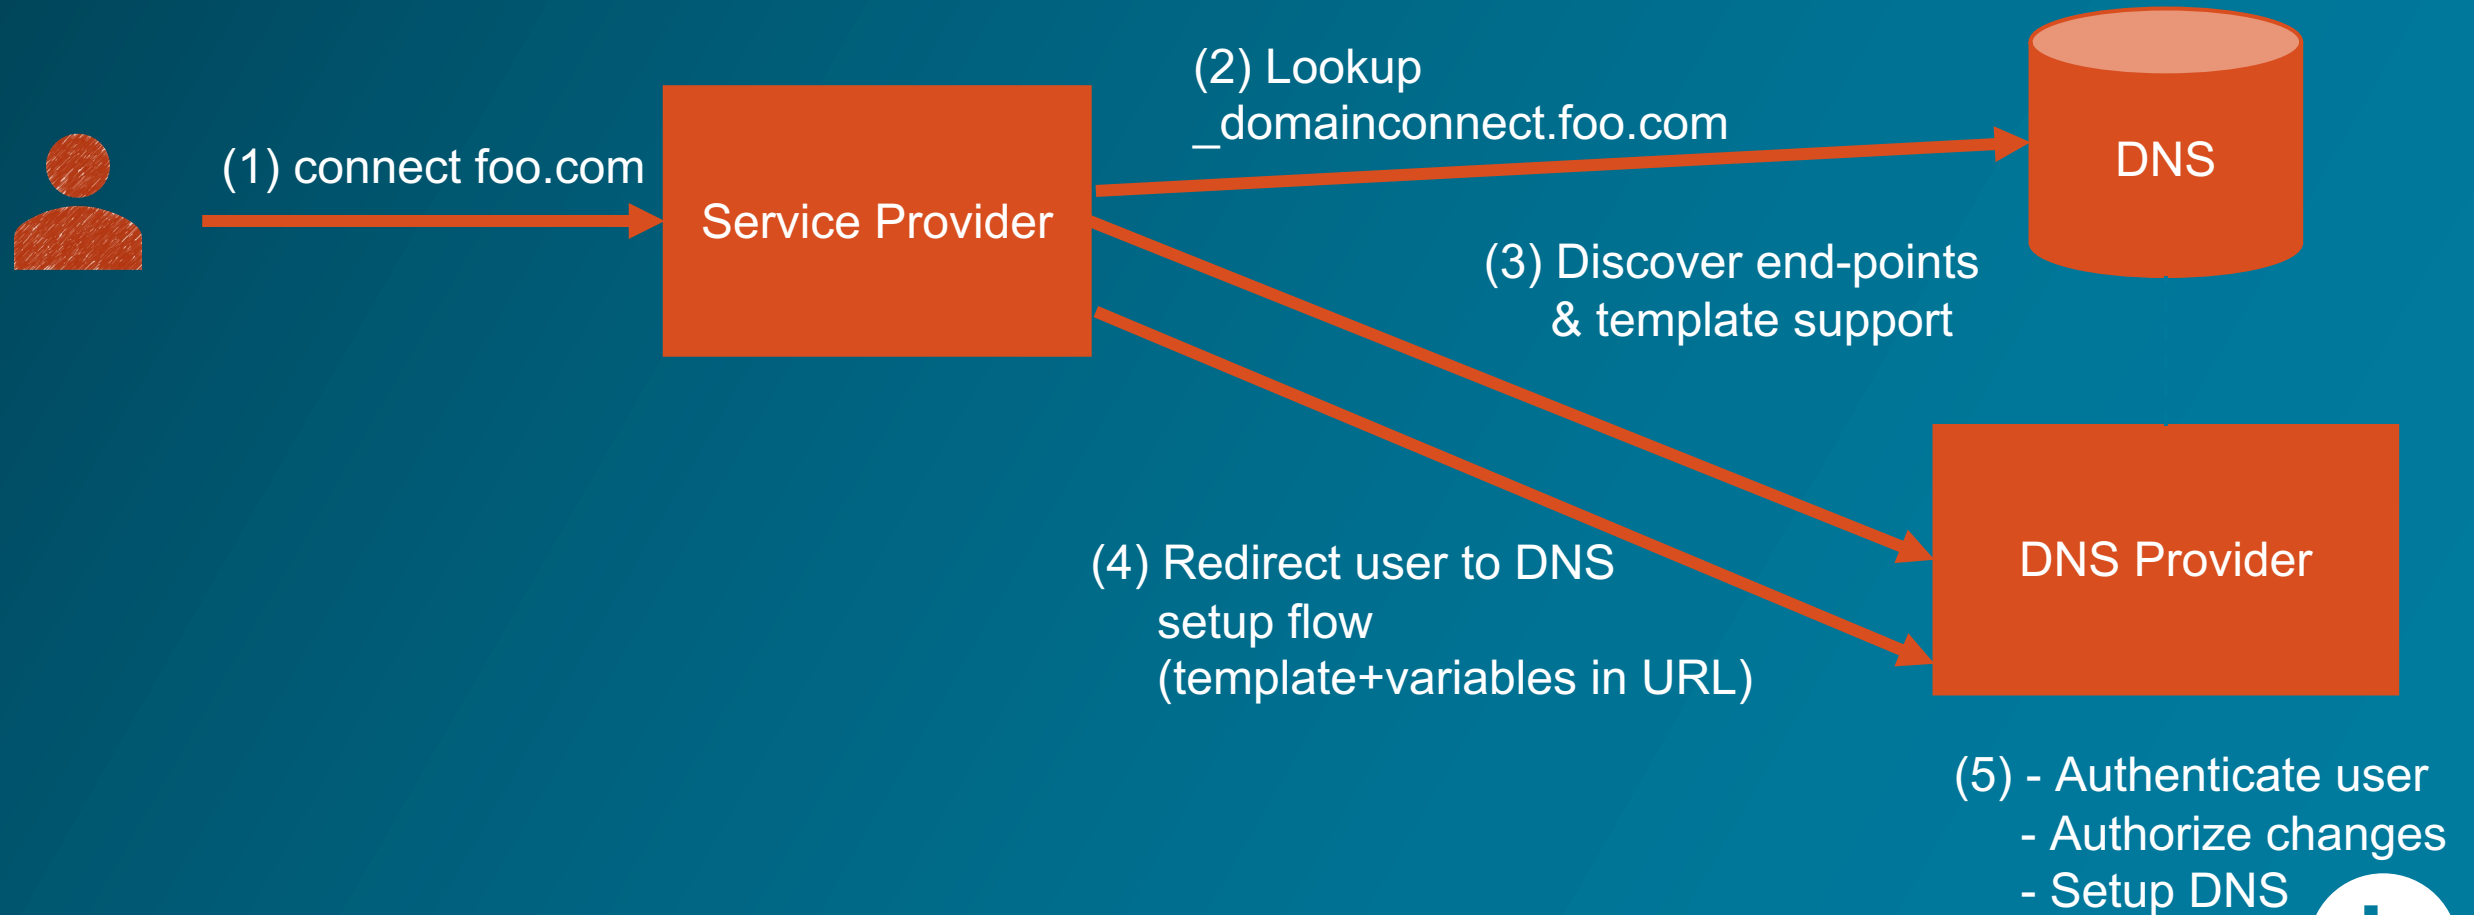

What is Domain Connect

- Open Standard protocol first proposed by GoDaddy in 2016
- Makes DNS setup to integrate 3rd party products and DNS setup less complicated and error prone
- Minimum authorization scope based on templates
- Customer experience that is simple, integrated and seamless
- Operational gains for both service and DNS providers

How it works?

Features

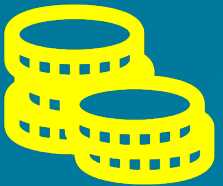

- Templates that define the API contract between the providers
- 2 flows:
 - One-off synchronous flow
 - Recurrent asynchronous flow using OAuth
- Conflict resolution on RR level
 - Merging of SPF TXT records from different services
- Support for ephemeral records (like ownership verification)
- URL protected with signature

Implementation status

- DNS Providers
 - ~20 providers, incl. GoDaddy, IONOS, Cloudflare, Squarespace Domains (former Google), Wordpress.com or Plesk
 - + some other undisclosed upcoming
 - 35% of the .com zone (May'24)
- Service Providers
 - 300 templates from over 120 providers, incl. O365, Google Workspace, Apple Cloud+, Weebly, Squarespace...
- The specification is quite stable now, but still some providers reluctant to adopt a non-standard.
 - ➡ this is now being addressed through IETF process (dconn WG in formation)

Possible other use cases

- Registrar/registry related use-cases:
 - Explicit DNSSEC bootstrapping (alternative to CDS/CDNSKEY polling)
 - Nameserver change
- Sell + configure flow:
 - Instead of configuring an existing domain registrar would directly register a new one and configure DNS

What is there for me?

- For registries:
 - Watch out your zone for _domainconnect records
 - Spread the word, make your registrars aware
- For registrars / resellers / DNS providers:
 - Consider adding Domain Connect to your product
 - Improve user experience
 - Lower support effort

RPP – a short mention (RESTful Provisioning Protocol)

Pawel Kowalik (DENIC)

What is RPP and how to contribute

- RPP is a **new provisioning protocol**, functional alternative to EPP:
 - Based on RESTful principles
 - HTTP with JSON
- IETF “rpp” working group takes care of development
<https://datatracker.ietf.org/wg/rpp/>
- 📌 Subscribe to the **mailing list** to stay on track
- 🎯 Current milestone: **Requirements**. Please Feedback.
<https://datatracker.ietf.org/doc/draft-ietf-rpp-requirements/>

THANK YOU!
